CC The present sequence represents a G-protein coupled receptor polypeptide contains a human splice variant of a chemokine receptor CXCR4B, which is a human splice variant of a chemokine contains a susceptibility to diseases by detecting mutations or contains a susception of cancer and polypeptides and polypeptides are useful for contains of cancer also useful for screening for the presence or amount of caponists which can be used to treat conditions associated with CXCR4B colypeptide imbalance. CXCR4B polypeptides can be administered directly (as a vaccine) or via a vector (gene therapy) to prevent disease.

CC Diseases diagnosed, prevented and treated include: HIV-1 and HIV-1 (as a vaccine) or via a vector (gene therapy) to prevent disease.

CC Parkinson's disease; acute heart failure; hypotension; hypertension; curinary retention; osteoprosis; angina pectoris; myocardial infarction; crantaitor, osteoprosis; angina pectoris; myocardial infarction; crantaitor, solvension; benign prostatic hypertrophy, migraine; continued the syndrome. CXCR4B polypeptides are useful for mapping genes continued the syndrome. CXCR4B polypeptides are useful for mapping genes continued contromosomes, allowing gene inheritance to be studied through linkage can be continued through linkage and contents and co

The present sequence represents the human RM3 protein which is encoded by the full length genomic RM3 clone (V18357) which was isolated from a human macrophage cDNA library. The invention claims for the full clength v28 genomic DNA sequence (V1835) isolated from a human placenta genomic library. The v28 (W48722) and RM3 proteins are seven transmembrane (77M) receptors which are probably involved in signal transmembrane (77M) receptors which are probably involved in signal transmembrane to produce the recombinant polypeptide, to produce anti-v28 antibodies or in screening assays for v28 agonists or antagonists. The antibodies, agonists and antagonists could then be used to modulate v28 receptor-ligand binding, for e.g. in immunological and/or inflammatory events in vivo.

Example 11: Page 84-85: 100pp: English
Two primers (066148, 066149) were used in a PCR reaction containing human macrophage cDNA library in plasmid pRC/CMV. When the PCR products were subjected to agarose gel electrophoresis a faint band of 180-200 base pairs was observed. Re-amplified material was digested with BanHI and HindIII and cloned into the plasmid Bluescript SK- Of sixteen clones sequenced, two contained a unique sequence termed RM3. Specific primers for the partial RM3 clone were used to identify a full length RM3 CDNA clone (066179) which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          DNA encoding seven trans:membrane receptors prods. for use as therapeutic or diagnostic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Primer; seven transmembrane receptor; polymerase chain reaction.

The nucleic acid is isolated from mouse pre-B cell line DW34. The receptor and cells expressing it can be used in the study and mapping of the mechanism of HIV infection and in screening of potential inhibitors of HIV infection and the development of AIDS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               WO9835035-A1.

This represents a rodent chemokine receptor HST01.1 amino acid sequence. The invention provides novel primate and rodent chemokines and chemokine compounds (optionally receptors. The chemokines, receptors and binding compounds (optionally receptors. The chemokines, receptors and binding compounds (optionally contibodies/fragments specifically binding the chemokines) are useful contibodies/fragments specifically binding the chemokines are useful conditions associated with abnormal physiology therapeutically to treat conditions associated with abnormal physiology or development e.g. inflammatory conditions such as asthma. Chemokines are important in immune and inflammatory responses in that they induce conditions such as asthma. Chemokines are important in immune and almamatory responses in that they induce conditions are also chemoattractants for consistent cells involved in inflammation and can induce other biological several cells involved in inflammation and can induce other biological cesponses e.g. modulation of second messenger levels (e.g. Ca++), conceptors of chemokine and chemokine responses et. The chemokine receptors of the invention exhibit structural properties of G-protein coupled conceptors (GPCR), although their ligands have not yet been identified. Conceptors (GPCR), although their ligands have not yet been identified. Consideration exhibits the receptor polypeptides are useful to produce themokine receptor polypeptides are useful to produce complexes in vivo or in assay techniques. Assays may considered to produce the physiological responses in cells can be used to modulate the physiological responses in cells can also used to produce antibodies useful diagnostically, for drug care also used to produce antibodies useful diagnostically, for drug care also used to produce antibodies useful diagnostically, for drug care also allow transformation of cells for polypeptides, and to isolate the polypeptides or related sequences, especially from other species. They also allow transformation of cells fo

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Greenfield EA, Lard Witt DT; Witt DT; WFI; 95-336945/43.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Monoclonal antibody against recombinant II-8 receptor polypeptide useful for treating inflammatory disorders, for detecting neutrophil(s) and for isolating II-8 receptor from liq.mixt. Claim 5; Fig 4A-B; 74pp; English I.

Claim 5; Fig 4A-B; 74pp; English II-8 receptor structure in the receptor structure in the receptor from liq.mixt.

Monoclonal antibodies were raised against recombinant interleukin-8 (II-8) receptor subtypes A and B from both human and rabbit sources (R80950-53 encoded by 099949-52). The A subtype receptor (II-8rA) is a high affinity receptor and the B subtype receptor (II-8rB) is a high affinity receptor and the B subtype receptor (II-8rB) is a low affinity receptor. The monoclonal antibody (mAb) pref. binds to the II-8 binding domain thus blocking its activation. The mabs are useful for treating inflammatory disorders (see key words) and for detecting the presence of neutrophils in a biological sample. The mabs are also useful in the isolation of II-8 receptors from a mixture.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            09-MAR-1995; U03032.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Qy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                В
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Hybrid peptides for binding cycokines, comprising a malaria parasite CP Plasmodium falciparum) peptide (capable of binding to a red blood CC cell (RBC)) and a receptor peptide are claimed. R70103-25 are examples CC of these hybrid peptides. R70124 is a fusion of interleukin 8 receptor CC type 2 and glycophorin binding protein (GBP) 130. The use of cytokine CC receptors not normally found on RBCs means that the cytokine can bind CC harmlessly to the RBC without deleterious effect. The RBC protects the CC hybrid peptides from excretion from the kidney, and due to steric CC hindrance prevents the cytokines binding to a receptor in another cell. CC GBP 130 or GBPH (GBP homologue) are the prefid. malaria parasite peptides used, others include EBA 175 (175 kDa erythrocyte binding antigen), CC receptor molecule (eg. exhibited by plasmodium vivax). These peptides CC bind to pref. glycophorin A, B and C, sialo glycoptoteins, found on the surface of RBCs. The hybrid peptides are thus used to lower the levels of free cytokines in the circulation to reduce pathological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

IL8-R type 2-GBP 130 fusion protein.
Hybrid peptide; malaria parasite; Plasmodium falciparum; fusion protein; red blood cell; cytokine receptor; glycophorin binding peptide 130; caph: glycophorin binding peptide homologue; glycophorin A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             a receptor peptide.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        PS Disclosure; Fig 2: 71pp; English.

CRabbit high affinity IL-8 receptor gene was isolated from rabbit peritoneal neutrophils and used as a source of poly(A)+ RNA, to produce a rabbit neutrophil cDNA library. 250,000 recombinant produce a rabbit neutrophil cDNA library. 250,000 recombinant produce a rabbit neutrophil cDNA library. 250,000 recombinant produce derived from those which hybridized to an antisense oligonucleotide (030015). This probe was designed based on the coupled receptors. After tertiary screening, six plaques were coupled receptors. After tertiary screening, six plaques were isolated. The insert of one of these plaques, termed F3R was of 2.5 kb in size. This insert was sequenced. The protein deduced from the F3R clone demonstrates that it belongs to the family of corpotein-coupled receptors. The deduced protein sequence indicates seven putatuve transmembrane segments. A human peripheral blood leukocyte lambda gtll cDNA library (5' stretch) was screened with a 652 bp EcoRI/BamHI fragment (including nucleotides 2.7 to 625) of the rabbit F3R clone. After tertiary screening several human clones which hybridized to the rabbit IL-8 probe were isolated. The insert of one such clone, termed 4AB was sequenced (330012).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches

Rew interleukin-8 receptor aminoacid sequence - and corresp. cDNA properties of interleukin-8 receptor and gene therapy expressed in Xenopus laevis oocytes or transfected host cells, for screening ligands of IL-8 receptor and gene therapy claim 1; Fig 3; 39pp; English.

CONA libraries from 2 and 3.5 kb fractions of poly(A)+ RNA from HL60 neutrophils sepd. of a sucrose gradient were made in UniZAP. The Clibraries were screened with F3R oligonucleotide probe (from rabbit IL-8 receptor) and under low stringency with a p2 cDNA probe crown from random primers, to isolated the clone p2, encoding continuity of the p2 clone as probes. P2 may also be used to screen corrections of the p2 clone as probes. P2 may also be used to screen correctlular calcium-mobilising and ligand-binding properties.

Antibodies directed against the interleukin-8 receptor B can be used to treat or prevent inflammation e.g. psoriasis, dermatitis, rheumatoid arthritis and particularly inflammatory bowel disease and chronic lung inflammation. When immobilised, these antibodies may be used to detect interleukin-8 receptor B expression in cells and tissues and for affinity purification of interleukin-8 receptor B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New antibodies against interleukin or prevent inflammation, also for o

Treatment of inflammatory disorders - by administering an antibody capable of binding a platelet factor 4 superfamily receptor polypeptide

S Disclosure: Page 54-56; 83pp; English.

C PF4AR members were identified by probing lambda libraries from thuman monoclyte-like cell line HL-60 and human peripheral blood lymphocytes using a large fragment of IL-8 receptor DNA (full sequence given in Q80520). The nucleotide sequences of the 2 PF4ARs are given in Q80521 and Q80522, and their respective amino acid sequences in R68812 and R68813.

                                                                                                                                                                                                                                              chronic lung inflammation. When immobilised, these antibodies may be used to detect interleukin-8 receptor B expression in cells and tissues and for affinity purification of interleukin-8 receptor B from cells. This sequence is an additional chemokine superfamily receptor which was identified by probing lamda libraries of genomic DNA from a human monocyte-like cell line (L-60) and human peripheral blood lymphocytes using a large fragment of the interleukin-8 type A receptor DNA (See Q99006).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1501
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1501
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Q99007;

                                                 Isolated human platelet factor 4 super-family receptor polypeptide and corresp. antibodies and DNA - useful as diagnostic and screening agents, and for treating inflammation or PF4AR-mediated disorders

Sclaim 7; Fig 4; 78pp; English.

Chaim 7; Fig 4; 78pp; English.

Screen Fire receptor cDNA sequence was isolated (see Q29505) and a contained of the coding sequence was used as a probe to screen human cell line HL60 and human peripheral blood lymphocyte CoDNA libraries. Two new gene sequences were found that are clearly crelated to the II-8 receptor. One of these was contained in combined clone 8rr.20.15 and is predicted to encode an amino acid sequence which is 34% identical with both the high and low affinity II-8 receptors. See also Q37107.

PT New 6 protein coupled receptor (CXCR4B) polypeptide and polynucleotide, human splice variant of a chemokine receptor - prolynucleotide, human splice variant of a chemokine receptor - prolynucleotide, human splice variant of a chemokine receptor prolynucleotide and for prevention and treatment of provided infection, cancer, stroke and dementia coupled receptor polypeptide CC The present sequence encodes a G-protein coupled receptor polypeptide coupled receptor CXCR4B, which is a human splice variant of a chemokine receptor CXCR4B. CXCR4B polynucleotides and polypeptides are useful for CC diagnosing susceptibility to diseases by detecting mutations or CC polymorphisms in the CXCR4B gene or analysing for integration and CC polynucleotides are also useful for screening for antagonists and CC polynucleotides are also useful for screening for antagonists and CC polynucleotides are also useful for screening for antagonists and CC polynucleotide imbalance. CXCR4B polypeptides can be administered directly (as a vaccine) or via a vector (gene therapy) to prevent disease. CC pliseases diagnosed, prevented and treated include: HIV-1 and HIV-1 CC infections; cancer; pain; diabetes; obesity; anorexia; bulimia; asthma; parkinson's disease; acute heart failure; hypotension; hypertension; cc vaniting; psychotic and neurological disorders; including anxiety, stroke; ulcers; allergies; benign prostatic hypertrophy; migraine; cc vaniting; psychotic and neurological disorders, including anxiety, schizother, and dyskinesias, such as Huntingtons disease or Gilles de CC to chromosomes, allowing gene inheritance to be studied through linkage CC analysis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            PT DNA encoding V28 seven transmembrane receptor polypeptide - useful procession v28 seven transmembrane receptor polypeptide - useful procession producing recombinant polypeptide and anti-V28 antibodies, and procession producing recombinant polypeptide and antagonists and antagonists seven in screening assays for V28 spissh.

CC The present novel sequence represents the human RM3 cDNA isolated from a human macrophage cDNA library. The invention claims for the full length V28 genomic DNA sequence (V18343) isolated from a human procession contains the invention claims are seven cransmembrane (7TM) receptors which are probably involved in signal transduction. The invention also claims that cells transformed with CC v28 DNA can be used to produce the recombinant polypeptide, to produce the invention also claims that cells transformed with CC v28 DNA can be used to produce the recombinant polypeptide, to produce cantiagonists. The antibodies, agonists and antagonists or conducted the modulate v28 receptor-ligand binding, for e.g. in immunological cand/or inflammatory events in vivo.

When the PCR products were subjected to agarose gel electrophoresis a faint band of 180-200 base pairs was observed. Re-amplified material was dispested with BamHI and HindIII and cloned into the plasmid Bluescript SK. Of sixteen clones sequenced, two contained a unique sequence termed RM3. Specific primers for the partial RM3 clone were used to identify this full length RM3 cDNA clone. Sequence 1317 BP; 332 A; 343 C; 264 G; 378 T;

Claim 3; Pages 39-42; 76pp; Japanese.
The present sequence encodes a murine CXC chemokine receptor which binds to the mouse CXC chemokine pre-B cell stimulatory factor PBSF/SDF-1. The nucleic acid is isolated from mouse pre-B cell line DW34. The receptor and cells expressing it can be used in the study and mapping of the mechanism of HIV infection and in screenin of potential inhibitors of HIV infection and the development of AII sequence 1877 BP; 469 A; 451 C; 406 G; 551 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1250

T New G protein coupled receptor (CXCR4B) polypeptide and polynucleotide, human splice variant of a chemokine receptor useful as diagnostic reagents and for prevention and treatment of T Useful as diagnostic reagents and dementia T HIV infection, cancer, stroke and dementia Claim 13; Page 18; 24pp; English. C The present sequence encodes a partial G-protein coupled receptor Cdesignated CXCR4B, which is a human splice variant of a chemokine creceptor CXCR4. CXCR4B polynucleotides and polypeptides are useful c diagnosing susceptibility to diseases by detecting mutations or c polymorphisms in the CXCR4B gene or analysing for the presence or polymorphisms in the CXCR4B gene or analysing for antagonists and collectides are also useful for screening for antagonists and	AAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAA	TCA TCA AAG AAG	TITTCCTGTAAAAAGACGTGAT TITTTCCTGTTATGACGACGTGAT TITTTGCTTATGCTGTGTGTATGTTTTTTTTTTTTTTTTT		AAATATIGTTTTTGTTTGTTTTCATGTGAATGAGCGTCTAGGCAGGACCTGTGCC TCTTAGTTGCTATGTCTCGTGGTAGGACTGTAGAAAAGGGAACTG

Claim 1; page 571-572; 2245pp; Japanese. A single-stranded DNA (or its complementary strand or the corresp. double-stranded DNA) which comprises one of the 7837 "GS" sequences given in Tig001-Tig0837 and which is able to hybridise to part of human genomic DNA, CDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed CDNA libraries prepared from various human tissues; synthesis of CDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-untranslated sequence is unique to a particular mRNA species, almost
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            agonists which can be used to treat conditions associated with CXCR4B polypeptide imbalance. CXCR4B polypeptides can be administered directly (as a vaccine) or via a vector (gene therapy) to prevent disease. Diseases diagnosed, prevented and treated include: HIV-1 and HIV-1 infections; cancer; pain; diabetes; obesity; anorexia; bulimia; asthma; Parkinson's disease; acute heart failure; hypotension; hypertension; urinary retention; osteoporosis; angina pectoris; myocardial infarction; stroke; ulcers; allergies; benign prostatic hypertrophy; migraine; vomiting; psychotic and neurological disorders, including anxiety, schizophrenia, manic depression, delirium, dementia and severe mental retardation; and dyskinesias, such as Huntingtons disease or Gilles de la Tourette syndrome. CXCR4B polypeptides are useful for mapping genes analysis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gene signature; messenger RNA; mRNA; relative abundance; frequency; human; cloning; mapping; non-biased library; diagnosis; detection; cell typing; abnormal cell function; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       01-JUN-1995.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Qy
               interleukin-8 binding antagonists, used to treat inflammation

bisclosure; Fig 1; 71pp; Engilsh.

Rabbit high affinity IL-8 receptor gene was isolated from rabbit peritoneal neutrophils and used as a source of poly(A) + RNA, to produce a rabbit neutrophil cDNA library. 250,000 recombinant plaques were screened for those which hybridized to an antisense oligonucleotide (030015). This probe was designed based on the sequence derived from the second transmembrane domain of G-protein-coupled receptors. After tertiary screening, six plaques were isolated. The insert of one of these plaques, termed F3R was of 2.5 kb in size. This insert was sequenced. The protein deduced from the F3R clone demonstrates that it belongs to the family of G-protein-coupled receptors. The deduced protein sequence indicates seven putatuve transmembrane segments.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

IL-8 receptor polypeptide; G-protein-coupled receptor;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for recognising different cell types.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Monoclonal antibody against recombinant IL-8 receptor polypeptide -
y useful for treating inflammatory disorders, for detecting resembling Inflammatory disorders, for detecting resembling III-8 receptor from liq.mixt.

The neutrophil(s) and for isolating IL-8 receptor from liq.mixt.

Scalaim 2; Fig lA-B; 74pp; English.

Monoclonal antibodies were raised against recombinant interleukin-8 (II-8) receptor subtypes A and B from both human and rabbit sources (R80950-53 encoded by Q99949-52). The A subtype receptor (II-8rA) is a low affinity receptor and the B subtype receptor (II-8rB) is a low affinity receptor. The monoclonal antibody (mAb) pref. binds to the II-8 binding domain thus blocking its activation. The mabs are useful for treating inflammatory disorders (see key words) and for detecting the presence of neutrophils in a biological sample. The mAbs are also useful in the isolation of II-8 receptors from a mixture.

                                                                                                                                                                                                                                                       Monoclonal antibody against recombinant IL-8 receptor polypeptide - y useful for treating inflammatory disorders, for detecting reutrophil(s) and for isolating IL-8 receptor from liq.mixt.

Claim 6; Fig 3A-B; 74pp; English.

Monoclonal antibodies were raised against recombinant interleukin-8 (IL-8) receptor subtypes A and B from both human and rabbit sources (R80950-53 encoded by 099949-52). The A subtype receptor (IL-8rA) is a low affinity receptor and the B subtype receptor (IL-8rB) is a low affinity receptor. The monoclonal antibody (mab) pref. binds to the IL-8 binding domain thus blocking its activation. The mabs are useful for treating inflammatory disorders (see key words) and for detecting the presence of neutrophils in a biological sample. The mabs are also useful in the isolation of IL-8 receptors from a mixture.

A cDNA library constructed from human neutrophil mRNA in the mammali expression vector pRK5B was transfected into COS-7 cells as pools of 2500 clones. One positive pool from the first 58 transfections was partitioned into smaller pools until a pure clone (pRK5B.il8r1.1) was obtained. The ORF encodes a protein of 350 amino acids which shares several features with the G-protein coupled receptors of the rhodopsin superfamily, including 7 hydrophobic (transmembrane) domains. A cDNA library constructed from human neutrophil mRNA in pRK5B was transfected into COS-7 cells, and the cells were screened with 1251 IL-8. The DNA sequence of isolated cDNA clone pRK5B.il8r1.1, encoding human IL-8 receptor, is given in Q80520 and the predicted amino acid sequence in R68811. The receptor is used to raise antibodies that neutralize the activity of pF4AR, e.g. IL-8 recepto Sequence 1933 BP; 422 A; 540 C; 485 G; 486 T:

type B re
Sequence
                         Example 2; Columns 43-46; 62pp; English.
Antibodies directed against the interleukin-8 receptor B can be u
to treat or prevent inflammation e.g. psoriasis, dermatitis,
rheumatoid arthritis and particularly inflammatory bowel disease
chronic lung inflammation. When immobilised, these antibodies ma
be used to detect interleukin-8 receptor B expression in cells and
tissues and for affinity purification of interleukin-8 receptor B
from cells. A sequence obtained from this CDNA insert, which
encodes the high affinity interleukin-8 receptor, was used to
probe lambda gt10 cDNA libraries for the human interleukin-8
                                                                                                                                                                                                                                                                                                                                                                                                                       Interleukin: IL-8; inflammation; psoriasis; derma rheumatoid arthritis; inflammatory bowel disease; chronic lung inflammation; treatment; antibody; affinity purification; detection; ss.
